

# JQuery 动手实验

# Agenda

- ① JQuery Introduction
- ② JQuery in practice

# What is jQuery?

jQuery is a fast, small, and feature-rich JavaScript library. It makes things like HTML document traversal and manipulation, event handling, animation, and Ajax much simpler with an easy-to-use API that works across a multitude of browsers. With a combination of versatility and extensibility, jQuery has changed the way that millions of people write JavaScript.

# What is jQuery ?

jQuery is a **JavaScript library** that provides an easy way for developers to add JavaScript to their websites.

jQuery is an open source and cross-platform JavaScript library that can help web developers perform document traversal and manipulation, event handling, animation, Ajax, applying styles, and more.

jQuery Website: <https://jquery.com>

- Add collapse/expandable content.
- Add animation
- Change CSS styles dynamically
- Perform Ajax requests (i.e. dynamically pull data from another location without refreshing the page)
- Create widgets for your site
- General HTML/DOM manipulation

# The ready() Method

- jQuery's **ready() method** allows you to run code as soon as the page's Document Object Model (DOM) becomes safe to manipulate.
- If you don't include this method (or some other equivalent), your code will run as soon as the browser encounters it.
- This could cause problems if your code tries to manipulate an object that hasn't loaded yet.

# The ready() Method

As of jQuery 3.0, only [the first syntax is recommended](#);  
the other syntaxes still work  
but are deprecated.

```
// Example 1
$(function() {
    ...
});
```

```
// Example 2
$( document ).ready(function() {
    ...
});
```

```
// Example 3
$.ready( handler )
...
});
```

# jQuery syntax

The jQuery syntax is very straightforward and allows you to add advanced functionality to your website with a minimum of code.

```
$(function() {  
    $( "p" ).text( "Hello" );  
});
```

Probably one of the most different things is that each line of code starts with dollar signs. These dollar signs are part of the jQuery syntax.

# About the Dollar Sign (\$)

- The \$ (dollar sign) is used to indicate that the following code is going to be jQuery. This helps distinguish between jQuery and regular JavaScript.
- The \$ is actually a shortcut for jQuery. The jQuery library is contained within the jQuery namespace, and so any jQuery code can also start with jQuery.

```
// Example 1
$(function() {
    $( "p" ).text( "Hello" );
});

// Example 2
jQuery(function() {
    jQuery( "p" ).text( "Hello" );
});
```

# Selectors

The basic concept of jQuery is, you select an element, then perform an action against that element.

```
// Select all "p" elements and write "Hello"
$( "p" ).text( "Hello" );

// Change the color of all "p" elements to red
$( "p" ).css( "color", "red" );

// Hide all elements with the ".shy" class
$( ".shy" ).hide();

// Show the element with the "#nav" id
$( "#nav" ).show();
```

# Events:

- jQuery uses events to determine when a block of code should run.
- Events are triggered when something happens within the DOM. Some events are triggered by user actions ( clicks on an element, moves the mouse, etc), other events are triggered by the browser ( the page has loaded, an animation has finished running).
- When you write jQuery/JavaScript, you need to specify when the code should run. If you don't do this, then it will simply run when the browser loads it.
- **Running a script as soon as the window loads isn't always desirable.** Most of the time you will only want the code to run **once a certain event has occurred.**

# jQuery 动手实验

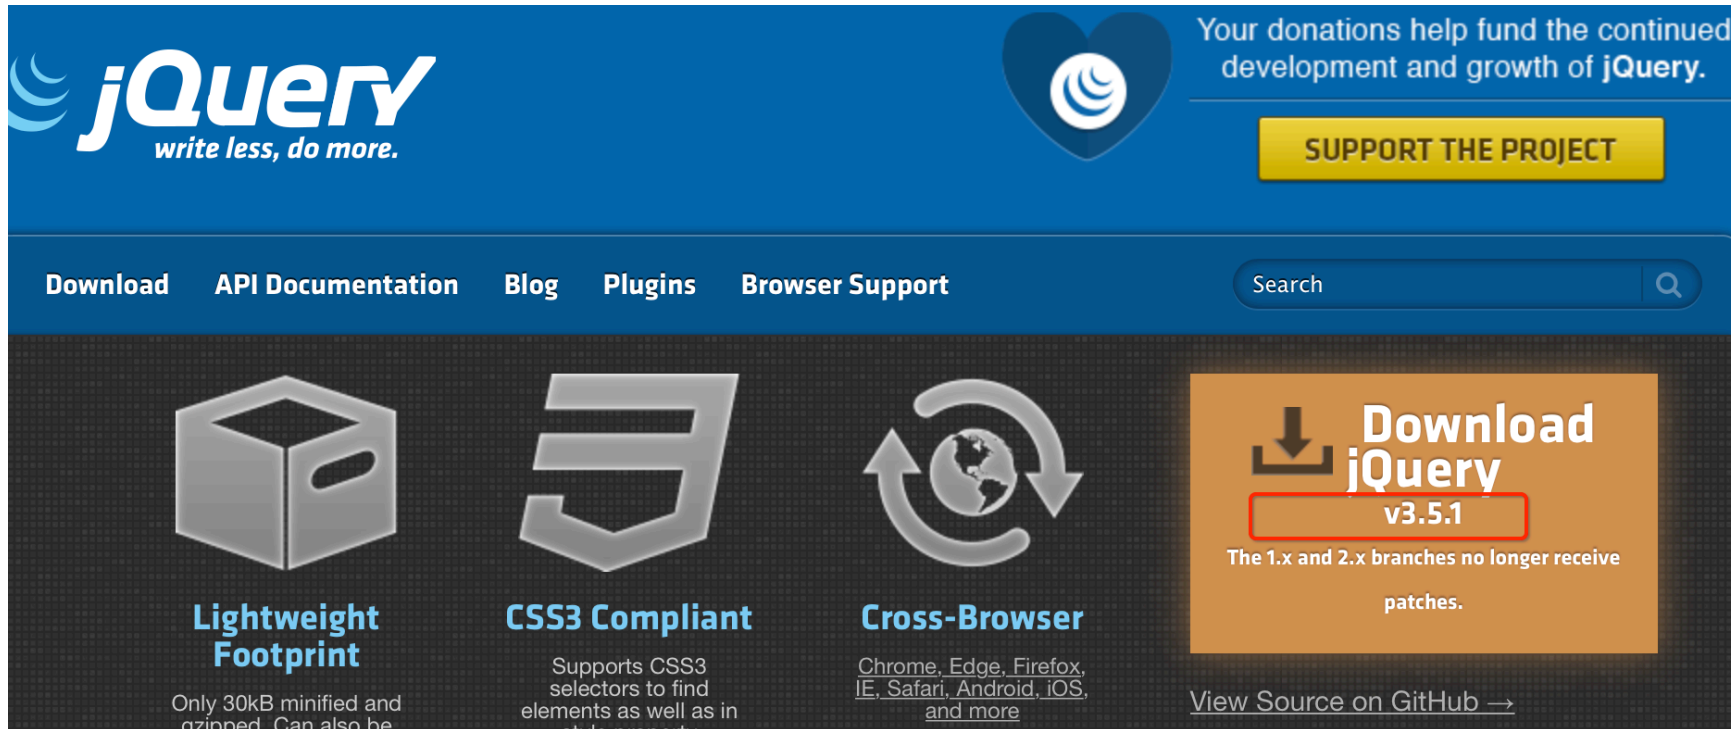

如何引入 jQuery ？

In order to use jQuery, you need to include the jQuery library in your web page.

<https://jquery.com/download/>

https://jquery.com

最新版本：3.5.1

The image shows the jQuery website homepage. At the top, there is a blue header with the jQuery logo on the left, which includes the text "jQuery" and "write less, do more." Below the logo is a navigation bar with links for "Download", "API Documentation", "Blog", "Plugins", and "Browser Support". On the right side of the header, there is a heart icon and the text "Your donations help fund the continued development and growth of jQuery.", followed by a yellow button that says "SUPPORT THE PROJECT". Below the navigation bar, there is a dark grey section with three main features highlighted: "Lightweight Footprint" (with a box icon), "CSS3 Compliant" (with a stylized 'E' icon), and "Cross-Browser" (with a circular arrow icon). To the right of these features is a large orange box with a download icon and the text "Download jQuery v3.5.1". Below this text, it says "The 1.x and 2.x branches no longer receive patches." At the bottom right of the orange box, there is a link that says "View Source on GitHub →".

**jQuery**  
write less, do more.

Your donations help fund the continued development and growth of jQuery.

**SUPPORT THE PROJECT**

[Download](#) [API Documentation](#) [Blog](#) [Plugins](#) [Browser Support](#)

**Lightweight Footprint**  
Only 30kB minified and gzipped. Can also be

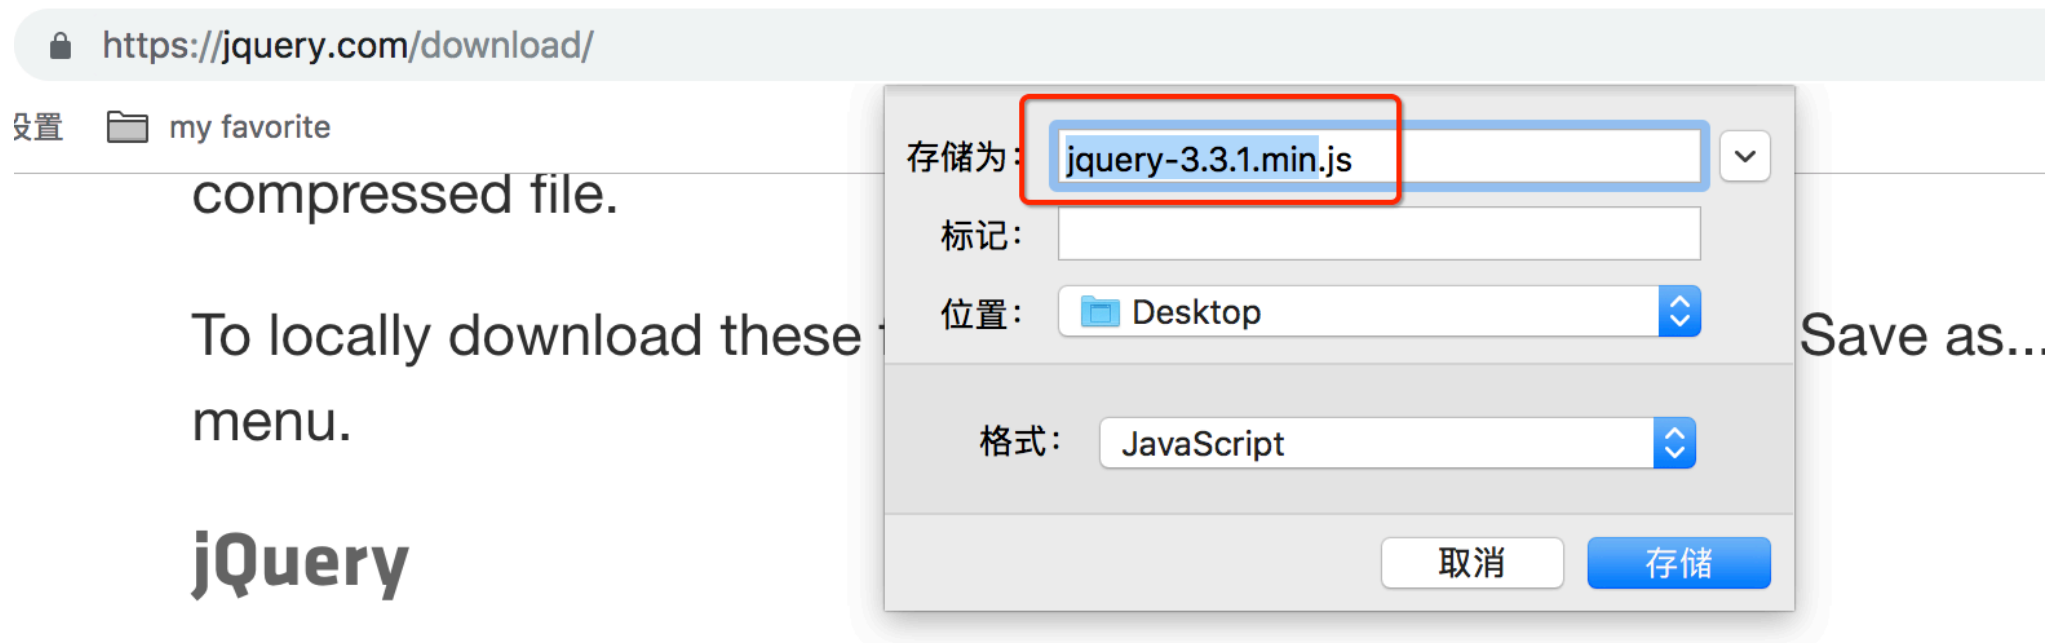

**CSS3 Compliant**  
Supports CSS3 selectors to find elements as well as in style property.

**Cross-Browser**  
Chrome, Edge, Firefox, IE, Safari, Android, iOS, and more

**Download jQuery**  
**v3.5.1**  
The 1.x and 2.x branches no longer receive patches.

[View Source on GitHub →](#)

# 如何引用 jQuery ? —— 方法1 : Download jQuery :

For help when upgrading jQuery, please see the [upgrade guide](#) most recent version. We also recommend using the [jQuery Migrate plugin](#).

[Download the compressed, production jQuery 3.3.1](#)

Be sure to place the file in a directory within your website, then link to it using the [script](#) element.

```
<script src ="./js/jquery-3.3.1.min.js" > </script>
```

it's usually a good idea to keep the file name the same as when you downloaded it, as it contains the jQuery version

# CDN 镜像资源推荐

</script>
```

## Case 1: Selector use case

# 选择器:

```
<script src="https://cdn.bootcss.com/jquery/3.4.0/jquery.min.js">
</script>
```

1. 创建 html 文件
2. 引入 jQuery CDN

```
<body>
  <script>
    $(function() {
      $("button").click(function() {
        $( "p" ).text( "Hello World" );
      })
    })
  </script>

  <button> click me </button>
  <p> </p>
</body>
```

## Case1

### 完整代码

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width,
initial-scale=1.0">
  <meta http-equiv="X-UA-Compatible" content="ie=edge">
  <title>Document</title>
  <script src = "../js/jquery-3.3.1.min.js" > </script>
</head>
<body>
  <script>
    $(function() {
      $("button").click(function() {
        $( "p" ).text( "Hello World" );
      })
    })
  </script>

  <button> click me </button>
  <p> </p>
</body>
</html>
```

# Use jQuery to traverse the DOM with ease

- jQuery includes a whole range of methods that make it easy to traverse (遍历) the DOM.
- The *DOM* (document object model) is the interface that enables JavaScript to interact with a web page's content.
- Whenever we use JavaScript (or jQuery) to inspect or manipulate elements on the web page, we're accessing the DOM.

*The **DOM** can be thought of as a **tree-like** structure, with each element being a separate node on that tree.*

- DOM traversal (遍历) basically means moving around the DOM that makes up the web page. When traversing the DOM, you can move back up the document tree to any desired element.
- You can also move down the hierarchy to a given child node, or across to a **sibling node** (同级节点)
- This enables you to navigate through an HTML page in order to find the exact spot at which you need to gather some data or make a change.

Traversing the DOM enables you to do things like:

- **Filter elements** based on a given criteria.
- **Insert new elements** at a particular place.
- **Remove elements** that match a given criteria.
- **Highlight one or more elements** within a group of elements.

# The `find()` Method

- The `find()` method enables you to get the descendants of each element in the current set of matched elements, filtered by a selector, jQuery object, or element.

```
$( "ul" ).find( "li ul" ).css( "background-color", "yellow" );
```

## Case 2: DOM Traversal (遍历)

效果图： 点击 button， 变色

Highlight all nested lists

- Apples
  - Big ones
  - Juicy ones
  - Red ones
- Oranges
- Papaya
  - Papaya carica
  - Carica
  - Carica pubescens
- Lychee
- Rambutan
- Passionfruit
- Mango

## Case 2: 完整代码

注意： 引入 jQuery

```
<script>
$( function() {
    $( "button" ).click( function() {
        $( "ul" ).find( "li ul" ).css( "background-color", "yellow" );
    });
});
</script>
```

```
<button>Highlight all nested lists</button>
```

```
<ul>
  <li>Apples
    <ul>
      <li>Big ones</li>
      <li>Juicy ones</li>
      <li>Red ones</li>
    </ul>
  </li>
  <li>Oranges</li>
  <li>Papaya
    <ul>
      <li>Papaya carica</li>
      <li>Carica</li>
      <li>Carica pubescens</li>
    </ul>
  </li>
  <li>Lychee</li>
  <li>Rambutan</li>
  <li>Passionfruit</li>
  <li>Mango</li>
</ul>
```

## Case 3: `html()` method

点击 button ， 显示不同内容：

Click me!

Don't do it!

Click me!

**Hey!** I thought I warned you not to do that!

## The html() Method

The `html()` method enables you to get the HTML contents of the first element in the set of matched elements or set the HTML contents of every matched element.

the following example sets the HTML content of the `.warning` class.

```
$( ".warning" ).html( "<p style='color:red;'><strong>2nd Warning</strong></p>" );
```

## Case 4: 完整代码:

**注意:** 要操作的元素，事先已创建好了。

```
<script>
  $( function() {
    $( "button" ).click( function() {
      $( ".warning" ).html( "<p style='color:red;
        font-size:larger;'><strong>Hey!</strong> I
        thought I warned you not to do that!</p>" );
    });
  });
</script>

<button>Click me!</button>
<div class="warning">
  <p>Don't do it!</p>
</div>
```

## Case 4: Add/Remove Classes with jQuery

jQuery provides methods that allow you to add and remove classes that are contained in your style sheet

The jQuery `addClass()`, `removeClass()`, and `toggleClass()` methods enable you to dynamically add and remove classes on HTML elements.

This can be useful when applying multiple style declarations, and it allows you to keep your styles within your style sheet while using jQuery to access them.

## The `addClass()` Method

- Here's how to use the `addClass()` method:

```
$( this ).addClass( "box" );
```

addClass 效果图:

Click me...

No, click me!

Click me...

No, click me!

## Case4: 完整代码: style 部分

```
<style>
  div {
    background: limegreen;
    color: white;
    padding: 10px;
    margin: 20px;
  }
  .different {
    border: px solid orange;
    background: gold;
    color: black;
  }
</style>
```

## Case4: 完整代码: body 部分

```
<body>
  <script>
    $(function () {
      $("div").click(function () {
        $(this).addClass("different");
      });
    });
  </script>
  <div>
    Click me...
  </div>
  <div>
    No, click me!
  </div>
</body>
```

## Case 5: Ajax Request

- Ajax (or AJAX) stands for Asynchronous JavaScript And XML.
- Ajax allows us to dynamically populate a web page using remote data without having to reload the page.

# The `load()` Method

- jQuery's `load()` method is the easiest way to do an Ajax call. It allows you to load data from the server and place the returned HTML into the matched element.
- To use the `load()` method, pass the file name in as a parameter. Like this:

```
$( "#data" ).load( "/latestData.html" );
```

## Using a Callback Function

You can provide a “complete” callback function that only runs after the HTML insertion has succeeded.

For example, you could use this callback function to display a "success" message to the user.

创建一个 JSON 文件: ./data/test.json

```
{
  "artists": [
    {
      "artistname": "Leonard Cohen",
      "born": "1934"
    },
    {
      "artistname": "Joe Satriani",
      "born": "1956"
    },
    {
      "artistname": "Snoop Dogg",
      "born": "1971"
    }
  ]
}
```

## Case5: 完整代码: Ajax callback function

```
<body>
  <script>
    $(function () {
      $("button").click(function () {
        $("#data").load("../data/test.json", function () {
          $("#status").html("<h1 style='color:tomato'>Done!</h1>");
        });
      });
    });
  </script>
  <button>Load Latest Data</button>
  <div id="data"></div>
  <div id="status"></div>
</body>
```

疑问： 为何没有数据？

开发工具 -> console 查看数据异常

```
from origin 'null' has been blocked by CORS policy: Cross origin requests  
are only supported for protocol schemes: http, data, chrome, chrome-  
extension, https.
```

这是因为跨域问题！

## Case 6: How to do Animation with jQuery?

# animate() method

- jQuery includes the `animate()` method that allows you to create an animation.
- More specifically, the `animate()` method enables you to perform a custom animation on a set of numeric CSS properties.
- The `animate()` method accepts many parameters but the only required parameter is the object of CSS properties.

# 实现一个渐变的动画过程

Run Animation!

Animation

Run Animation!

A n i m a t i o n

## Case6: 完整代码

```
<body>
  <script>
    $(function () {
      $("button").click(function () {
        $("#animation").animate({
          fontSize: "3em",
          letterSpacing: "+=0.3em"
        }, 1000);
      });
    });
  </script>
  <button>Run Animation!</button>
  <div id="animation">Animation</div>
</body>
```

## Case 7: CSS 条件变换

Click me...

Click me...

场景： 根据元素当前的 CSS， 设置新的CSS

```
<script>
$(function () {
    $("#1st").click(function () {
        if ($(this).attr("class") == "old")
            $(this).addClass("new");
    });
});
</script>

<div id="1st" class="old">
    Click me...
</div>
```

## 小结:

1. jQuery – DOM Traversal
2. jQuery – Add/Remove Class
3. jQuery – Ajax Request
4. jQuery - Animation
